

ABSTRACT OF THE DISCLOSURE

A memory device selling apparatus stores an analytical result of a defective detail in a memory device including fail bits as a result of a test performed in a final test apparatus into a database as memory device
5 information. A customer transmits an acceptable condition of a memory device defective from a customer terminal to the memory device selling apparatus. The memory device selling apparatus searches memory devices fitting the requirement of the customer, creates a combination of the memory devices, and transmits the results thereof to the customer
10 terminal. Thus, the memory device selling apparatus can sell a memory device, even though the device includes a fail bit, without any inconvenience on the customer.
